## COLOR THAT MEANS BUSINESS

Canon

PRISMA

PRISMA
color
Manager

Measure and manage detailed color performance with ease.

Identify color performance trends.

Validate color accuracy with easy to read verification reports.

Easily collect and interpret data for analysis.

Compare devices and monitor output over time.

SIMPLIFY COLOR MANAGEMENT

PRELOADED TEST CHARTS

Bring color performance to life with easy-to-understand reporting. PRISMAcolor Manager enables operators to manage color with simple steps, designed for use with specialists of varying skill sets. Quickly assess color measurement against industry standards with step-by-step directions in an intuitive interface.
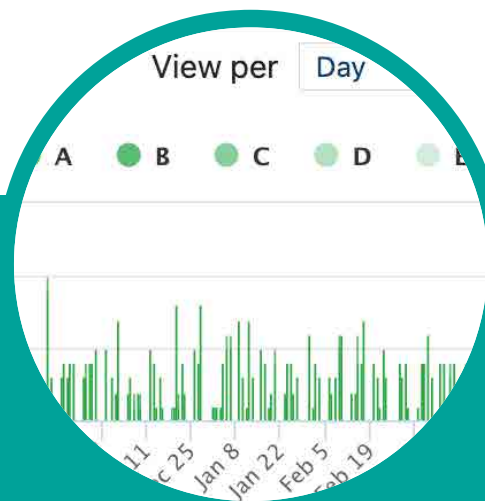

PRISMAcolor Manager helps print service providers to maintain high-quality color output across compatible Canon and non-Canon CMYK printers (ink and toner) by structuring the digital color measurement process and simplifying how results are displayed and analyzed.

Move color judgment from subjective visual assessment to objective reporting using the power of digital measurements. Validate results against industry standards or your organization's predefined tolerances.

GRAPHIC
REPORTING

Check Color Quality Quickly

Easily view graded results of color measurements against your chosen color targets with clear, graphic reporting.

Operators and color specialists can zoom in for a more detailed analysis of a specific printer, metric, or time period, including:

- Simple "pass/fail" and quality level grades.
- Detailed color patch measurement results.
- Device reliability and performance over time.

Simple User Interface

- Navigate easily through colorimetric data.
- Customize validation reporting displays.
- Compare collections of tests and results.

CONTROL COLOR WITH EASE

MAINTAIN CONSISTENCY

PRISMAcolor Manager shows the operator a simple, step-by-step screen with animations of precisely how to carry out color measurements—from initialization to generation of reports. This is designed to help users carry out tests correctly, which can help you to manage color tolerances and targets over time.

Graphic instruction and measurement task feedback helps guide the operator at each step, building confidence towards best practices.

MEASURE

Measurement is one of the key first steps to a color management workflow. With a few simple clicks, operators can quickly output a color measurement chart which can then be read for validation.

VALIDATE

Color management doesn't end there, however. With the validation results, operators within an organization can use this data to determine next steps, if any, and help identify the condition of the printer.

ANALYZE

Once the measurement chart is printed, the color patches are read in for validation to an industry standard color reference. Validation is what compares your output to the standard.

TREND

Trending is the final step of color control, where an organization can monitor the health of the printer over time with easy to read reporting and analysis.
